

Another Uneventful After Day... After Day...*

Important Risk Information

- PLAVIX is contraindicated in patients with active pathologic bleeding such as peptic ulcer or intracranial hemorrhage. As with other antiplatelet agents, PLAVIX should be used with caution in patients who may be at risk of increased bleeding from trauma, surgery, or coadministration with NSAIDs or warfarin. (See **CONTRAINDICATIONS** and **PRECAUTIONS**.)
- The rates of major and minor bleeding were higher in patients treated with PLAVIX plus aspirin compared with placebo plus aspirin in a clinical trial. (See **ADVERSE REACTIONS**.)
- As part of the worldwide postmarketing experience with PLAVIX, suspected cases of thrombotic thrombocytopenic purpura (TTP) have been reported at a rate of about 4 cases per million patients exposed. TTP has been reported rarely following use of PLAVIX, sometimes after a short exposure (<2 weeks). TTP is a serious condition requiring prompt treatment. (See **WARNINGS**.)
- In clinical trials, the most common clinically important side effects were pruritus, purpura, diarrhea, and rash; infrequent events included intracranial hemorrhage (0.4%) and severe neutropenia (0.05%). (See **ADVERSE REACTIONS**.)

* PLEASE SEE BRIEF SUMMARY OF PRESCRIBING INFORMATION AND REFERENCES ON LAST PAGE OF THIS AD.

Bristol-Myers Squibb and Sanofi-Synthelabo are proud members of the American Heart Association Pharmaceutical Roundtable.

Xopenex® (levalbuterol HCl) Inhalation Solution, 0.31 mg*, 0.63 mg*, 1.25 mg*

(20 (20-1685))

*Potency expressed as levalbuterol

BRIEF SUMMARY**INDICATIONS AND USAGE:** Xopenex (levalbuterol HCl) Inhalation Solution is indicated for the treatment or prevention of bronchospasm in adults, adolescents and children 6 years of age and older with reversible obstructive airway disease.**CONTRAINDICATIONS:** Xopenex (levalbuterol HCl) Inhalation Solution is contraindicated in patients with a history of hypersensitivity to levalbuterol HCl or racemic albuterol.**WARNINGS:** 1. **Paradoxical Bronchospasm:** Like other inhaled beta-adrenergic agonists, Xopenex Inhalation Solution can produce paradoxical bronchospasm, which may be life threatening. If paradoxical bronchospasm occurs, Xopenex Inhalation Solution should be discontinued immediately and alternative therapy instituted. It should be recognized that paradoxical bronchospasm, when associated with inhaled formulations, frequently occurs with the first use of a new canister or vial. 2. **Overdose of Sympathomimetics:** Adrenaline may deteriorate acutely over a period of hours or chronically over several days or longer. If the patient needs more doses of Xopenex Inhalation Solution than usual, this may be a marker of destabilization of asthma and requires reevaluation of the patient and treatment regimen, giving special consideration to the possible need for anti-inflammatory treatment, e.g., corticosteroids. 3. **Use of Beta-Adrenergic Agonists:** The use of beta-adrenergic agonist bronchodilators alone may not be adequate to control asthma in many patients. Early consideration should be given to adding anti-inflammatory agents, e.g., corticosteroids, to the therapeutic regimen. 4. **Cardiovascular Effects:** Xopenex Inhalation Solution, like all other beta-adrenergic agonists, can produce clinically significant cardiovascular effects in some patients, as measured by pulse rate, blood pressure, and/or symptoms. Although such effects are uncommon after administration of Xopenex Inhalation Solution at recommended doses, if they occur, the drug may need to be discontinued. In addition, beta-agonists have been reported to produce ECG changes, such as flattening of the T wave, prolongation of the QT interval, and ST segment depression. The clinical significance of these findings is unknown. Therefore, Xopenex Inhalation Solution, like all sympathomimetic amines, should be used with caution in patients with cardiovascular disorders, especially coronary artery disease, arrhythmias, and hypertension. 5. **In Not Clearly Documented Cases:** Fatalities have been reported in association with excessive use of inhaled sympathomimetic drugs in patients with asthma. The exact cause of death is unknown, but cardiac arrest following an unexpected development of a severe acute asthmatic crisis and subsequent hypoxia is suspected. 6. **Immediate Hypersensitivity Reactions:** Immediate hypersensitivity reactions may occur after administration of racemic albuterol, as demonstrated by rare cases of urticaria, angioedema, rash, bronchospasm, anaphylaxis, and laryngospasm/edema. The potential for hypersensitivity must be considered in the clinical evaluation of patients who experience immediate hypersensitivity reactions while receiving Xopenex Inhalation Solution.**PRECAUTIONS:** General: Levalbuterol HCl, like all sympathomimetic amines, should be used with caution in patients with cardiovascular disorders, especially coronary insufficiency, hypertension, and cardiac arrhythmias, in patients with convulsive disorders, hyperthyroidism, or diabetes mellitus, and in patients who are unusually responsive to sympathomimetic amines. Clinically significant changes in systolic and diastolic blood pressure have been seen in individual patients and could be expected to occur in some patients after the use of any beta-adrenergic bronchodilator. Large doses of intravenous racemic albuterol have been reported to aggravate preexisting diabetes mellitus and hypokalemia. As with other beta-adrenergic agonist medications, levalbuterol may produce significant hypokalemia in some patients, possibly through intracellular shunting, which has the potential to produce adverse cardiovascular effects. The decrease is usually transient, not requiring supplementation.**Information for Patients:** The action of Xopenex (levalbuterol HCl) Inhalation Solution may last up to 8 hours. Xopenex Inhalation Solution should not be used more frequently than recommended (Do not increase the dose or frequency of dosing of Xopenex Inhalation Solution without consulting your physician). If you find that treatment with Xopenex Inhalation Solution becomes less effective for symptomatic relief, your symptoms become worse, and/or you need to use the product more frequently than usual, you should seek medical attention immediately. While you are taking Xopenex Inhalation Solution, other inhaled drugs and asthma medications should be taken only as directed by your physician. Common adverse effects include palpitations, chest pain, fast heart rate, headache, dizziness, and tremor or nervousness. If you are pregnant or nursing, contact your physician about the use of Xopenex Inhalation Solution. Effective and safe use of Xopenex Inhalation Solution requires consideration of the following information in addition to that provided under Patient Instructions for Use (see complete prescribing information): Xopenex Inhalation Solution (single-use low-density polyethylene [LDPE] vials) should be protected from light and excessive heat. Store in the protective foil pouch between 20°C and 25°C (68°F and 77°F). Do not use after the expiration date stamped on the container. Unused vials should be stored in the protective foil pouch. Once the foil pouch is opened, the vials should be used within two weeks. Vials removed from the pouch, if not used immediately, should be protected from light and used within one week. Discard any vial if the solution is not colorless.

The drug compatibility (physical and chemical), efficacy, and safety of Xopenex Inhalation Solution when mixed with other drugs in a nebulizer have not been established.

Drug Interactions: Other short-acting sympathomimetic aerosol bronchodilators or epinephrine should be used with caution with levalbuterol. If additional adrenergic drugs are to be administered by any route, they should be used with caution to avoid deleterious cardiovascular effects.**1. Beta-Blockers:** Beta-adrenergic receptor blocking agents not only block the pulmonary effect of beta-agonists such as Xopenex (levalbuterol HCl) Inhalation Solution, but may also produce severe bronchospasm in asthmatic patients. Therefore, patients with asthma should not normally be treated with beta-blockers. However, under certain circumstances, e.g., as prophylaxis after myocardial infarction, they may be an acceptable alternative to the use of beta-adrenergic blocking agents in patients with asthma. In this setting, cardioselective beta-blockers could be considered, although they should be administered with caution.**2. Diuretics:** The ECG changes and/or hypokalemia that may result from the administration of non-potassium sparing diuretics (such as loop or thiazide diuretics) can be acutely worsened by beta-agonists, especially when the recommended dose of the beta-agonist is exceeded. Although the clinical significance of these effects is not known, caution a clinician the combination of beta-agonists with non-potassium sparing diuretics.**3. Digoxin:** Mean increases of 36% and 22% in serum digoxin levels were demonstrated after single-dose intravenous and oral administration of racemic albuterol, respectively, in normal volunteers who had received digoxin for 10 days. The clinical significance of these findings for patients with obstructive airway disease who are receiving levalbuterol HCl oral solution or a chronic beta-blocker, however, is unclear. Therefore, clinicians should carefully evaluate the serum digoxin levels in patients who are currently receiving digoxin and Xopenex Inhalation Solution.**4. Monoamine Oxidase Inhibitors or Tricyclic Antidepressants:** Xopenex Inhalation Solution should be administered with extreme caution to patients being treated with monoamine oxidase inhibitors or tricyclic antidepressants, or within 2 weeks of discontinuation of such agents, because the action of levalbuterol HCl on the vascular system may be potentiated.**Carcinogenicity, Mutagenicity, and Impairment of Fertility:** In carcinogenicity or impairment of fertility studies have been carried out with levalbuterol HCl oral solution. However, racemic albuterol sulfate has been evaluated for its carcinogenic potential and ability to impair fertility. In a 2-year study in Sprague-Dawley rats, racemic albuterol sulfate caused a significant dose-related increase in the incidence of benign neoplasms of the mesovarium at and above a dose of 2 mg/kg (approximately 2 times the maximum recommended daily inhalation dose of levalbuterol HCl for adults and children on a mg/kg basis). In another study, the effect was blocked by the coadministration of progesterin, a nonsteroidal beta-adrenergic antagonist. In an 18-month study in C57BL/6 mice, racemic albuterol sulfate showed no evidence of teratogenicity at dietary doses up to 500 mg/kg (approximately 250 times the maximum recommended daily inhalation dose of levalbuterol HCl for adults and children on a mg/kg basis). In a 22-month study in the Golden Hamster, racemic albuterol sulfate showed no evidence of teratogenicity at dietary doses up to 50 mg/kg (approximately 25 times the maximum recommended daily inhalation dose of levalbuterol HCl for adults and children on a mg/kg basis). Levalbuterol HCl was not mutagenic in the Ames test or the CHO/HPRT Mutation Forward Gene Mutation Assay. Although levalbuterol HCl has been tested for carcinogenicity, racemic albuterol sulfate was not carcinogenic in human peripheral lymphocyte assay or in an *in vitro* chromosome nonreciprocal assay. Reproductive studies in rats using racemic albuterol sulfate demonstrated no evidence of impaired fertility at oral doses up to 50 mg/kg (approximately 25 times the maximum recommended daily inhalation dose of levalbuterol HCl for adults on a mg/kg basis).**Toxicologic Effects - Pregnancy Category II:** A reproductive study in New Zealand White rabbits demonstrated that levalbuterol HCl was not teratogenic when administered orally at doses up to 25 mg/kg (approximately 13 times the maximum recommended daily inhalation dose of levalbuterol HCl for adults on a mg/kg basis). However, racemic albuterol sulfate has been shown to be teratogenic in mice and rabbits. A study in C57BL/6 mice gave racemic albuterol sulfate subcutaneous doses of 0.1 mg/kg (0.1 times the maximum recommended daily inhalation dose of levalbuterol HCl for adults on a mg/kg basis) and in 10 of 108 (9.3%) fetuses at 0.25 mg/kg (approximately equal to the maximum recommended daily inhalation dose of levalbuterol HCl for adults on a mg/kg basis). The drug did not induce cleft palate formation when administered subcutaneously at a dose of 0.25 mg/kg (equal to the maximum recommended daily inhalation dose of levalbuterol HCl for adults on a mg/kg basis). Cleft palate also occurred in 32 of 73 (43.8%) fetuses from females treated subcutaneously with 7.5 mg/kg of epinephrine (positive control). A reproductive study in Sprague-Dawley rabbits revealed zygosity in 7 of 19 (37%) fetuses when racemic albuterol sulfate was administered orally at a dose of 50 mg/kg (approximately 110 times the maximum recommended daily inhalation dose of levalbuterol HCl for adults on a mg/kg basis). A study in which pregnant rats were dosed with subcutaneous racemic albuterol sulfate demonstrated that drug-related material is transferred from the maternal circulation to the fetus. There are no adequate and well-controlled studies of Xopenex Inhalation Solution in pregnant women. Because animal reproduction studies are not always predictive of human response, Xopenex Inhalation Solution should be used during pregnancy only if the potential benefits justify the potential risk to the fetus. During pregnancy experience of racemic albuterol, various congenital anomalies, including cleft palate and/or cleft lip, have been rarely reported in offspring of patients being treated with racemic albuterol. Some of the mothers were taking multiple medications during their pregnancies. No consistent pattern of defects can be discerned, and a relationship between racemic albuterol use and congenital anomalies has not been established.**Use in Labor and Delivery:** Because of the potential for beta-adrenergic agonists to interfere with uterine contractility, the use of Xopenex Inhalation Solution for the treatment of bronchospasm during labor should be restricted to those patients in whom the benefits clearly outweigh the risk.**Nursing Mothers:** Levalbuterol HCl has not been approved for the management of protein labor. The benefit-risk ratio when levalbuterol HCl is administered for bronchospasm has not been established. Serious adverse reactions, including maternal pulmonary edema, have been reported during or following treatment of protein labor with beta-agonists, including racemic albuterol.**Nursing Mothers:** Plasma levels of levalbuterol after inhalation of therapeutic doses are very low in humans, but it is not known whether levalbuterol is excreted in human milk. Because of the potential for teratogenicity due to racemic albuterol in animal studies and the lack of experience with the use of Xopenex Inhalation Solution by nursing mothers, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother. Caution should be exercised when Xopenex Inhalation Solution is administered to nursing women.**Pediatrics:** The safety and efficacy of Xopenex (levalbuterol HCl) Inhalation Solution have been established in pediatric patients 6 years of age and older in one adequate and well-controlled clinical trial. Use of Xopenex in children is also supported by evidence from adequate and well-controlled studies of Xopenex in adults, considering that the pharmacology and the drug's experience here and effects in pediatric and adult patients are substantially similar. Safety and effectiveness of Xopenex in pediatric patients below the age of 6 years have not been established.**Geriatrics:** Below the age of 6 years of age in patients 65 years of age and older are very limited. A very small number of patients 65 years of age and older were treated with Xopenex Inhalation Solution in a 4-week clinical study (n=2 for 0.31 mg and n=2 for 1.25 mg). In these patients, Interoedemation was observed after the first dose on day 1 and after 4 weeks of treatment. There are insufficient data to determine if the safety and efficacy of Xopenex Inhalation Solution are different in patients < 65 years of age and patients 65 years of age and older. In general, patients 65 years of age and older should be started at a dose of 0.31 mg of Xopenex Inhalation Solution. If clinically warranted due to insufficient bronchodilator response, the dose of Xopenex Inhalation Solution may be increased in elderly patients as tolerated, in conjunction with frequent clinical and laboratory monitoring, to the maximum recommended dose.**ADVERSE REACTIONS (Adults and Adolescents > 12 years old):** Adverse events reported in > 2% of patients receiving Xopenex Inhalation Solution or racemic albuterol and more frequently than patients receiving placebo in a 4-week, controlled clinical trial are listed in Table 1.**Table 1: Adverse Events Reported in a 4-Week, Controlled Clinical Trial in Adults and Adolescents > 12 years old**

Body System Preferred Term	Percent of Patients			
	Placebo (n=75)	Xopenex 1.25 mg (n=72)	Xopenex 0.63 mg (n=72)	Racemic albuterol 2.5 mg (n=76)
Body as a Whole				
Allergic reaction	1.3	0	0	2.7
Flu syndrome	0	1.4	4.2	2.7
Accidental injury	0	2.7	0	0
Pain	1.3	1.4	2.8	2.7
Back pain	0	0	0	2.7
Cardiovascular System				
Tachycardia	0	2.7	2.8	2.7
Migraine	0	2.7	0	0
Digestive System

Cough increased	2.7	4.1	1.4	2.7
Infection viral	8.2	12.3	6.9	12.2
Rhinitis	2.7	2.7	11.1	6.8
Sneezing	2.7	1.4	4.2	2.7
Throat edema	0	1.4	2.8	0

The incidence of certain systemic beta-adrenergic adverse effects (e.g., tremor, nervousness) was slightly less in the Xopenex 0.63 mg group as compared to the other active treatment groups. The clinical significance of these small differences is unknown. Changes in heart rate 15 minutes after drug administration and in plasma glucose and potassium one hour after drug administration (day 1) and day 21 were clinically comparable in the Xopenex 1.25 mg and the racemic albuterol 2.5 mg groups (see Table 2). Changes in heart rate and plasma glucose were slightly less in the Xopenex 0.63 mg group compared to the other active treatment groups (see Table 2). The clinical significance of these small differences is unknown. After 4 weeks, effects on heart rate, plasma glucose, and potassium were generally diminished compared with day 1 in all active treatment groups.

Table 2: Mean Changes from Baseline in Heart Rate at 15 Minutes and in Glucose and Potassium at 1 Hour after First Dose (Day 1) in Adults and Adolescents > 12 years old

Treatment	Heart Rate (bpm)	Mean Change (Day 1)	
		Glucose (mg/dL)	Potassium (mEq/L)
Xopenex 0.63 mg, n=72	2.4	4.6	-0.3
Xopenex 1.25 mg, n=72	6.8	10.3	-0.3
Racemic albuterol 2.5 mg, n=76	2.7	8.2	-0.3
Placebo, n=75	-2.8	0.2	-0.3

No other clinically relevant laboratory abnormalities related to administration of Xopenex Inhalation Solution were observed in this study. In the clinical trial, a slightly greater number of adverse events, discontinuations due to adverse events, and clinically significant ECG changes were reported in patients who received Xopenex 1.25 mg compared to the other active treatment groups. The following adverse events, considered potentially related to Xopenex, occurred in more than 2% of the 282 subjects who received Xopenex and more frequently than patients who received placebo in any clinical trial:

Body as a Whole:	chills, pain, chest pain
Cardiovascular System:	ECG abnormal, ECG change, hypertension, hypotension, syncope
Digestive System:	diarrhea, dry mouth, dry throat, dyspepsia, gastroenteritis, nausea
Hemic and Lymphatic System:	lymphadenopathy
Musculoskeletal System:	lip edema, myalgia
Nervous System:	anxiety, hyperreflexia of the hand, insomnia, paresthesia, tremor
Special Senses:	eye itch

The following events, considered potentially related to Xopenex, occurred in less than 2% of the treated subjects but at a frequency less than in patients who received placebo: asthma exacerbation, cough increased, wheezing, yawning, and vomiting.

ADVERSE REACTIONS (Children 6 - 11 years old): Adverse events reported in > 2% of patients in any treatment group and more frequently than patients receiving placebo in a 4-week, controlled clinical trial are listed in Table 3.**Table 3: Most Frequently Reported Adverse Events (> 2% in Any Treatment Group) and More Frequently Than Placebo During the Double-Blind Period (ITT Population, 6-11 years Old)**

Body System Preferred Term	Percent of Patients			
	Placebo (n=62)	Xopenex 0.31 mg (n=66)	Xopenex 0.63 mg (n=67)	Racemic albuterol 1.25 mg (n=64)
Body as a Whole
